

FixTray Full Work Order Flows: In-Shop + Road-Call, Customer + Shop Staff

Page by page and step by step from creation through completion, payment, and post-payment effects based on current code.

A and B: Customer-Created Flows

- 1. Customer opens appointments flow at /customer/appointments/new.
- 2. NewAppointmentClient selects shop, visit type (in-shop or road-call), service, date/details, optional media.
- 3. Submit calls POST /api/appointments.
- 4. API creates appointment plus linked workOrder with status pending and serviceLocation from appointmentType.
- 5. Customer can monitor through detail route /customer/workorders/[id] and payment list /customer/payments.

Completion and Payment Steps

- 1. Shop updates work order state through PUT /api/workorders/[id] across pending, assigned, in-progress, waiting-estimate, waiting-for-payment, closed.
- 2. When set to waiting-for-payment, customer receives completion and payment-ready notifications.
- 3. Customer pays from /customer/workorders/[id] or /customer/payments via POST /api/payment/checkout.
- 4. Stripe returns to /payment/success or /payment/cancel.
- 5. Stripe webhook marks work order paid and closed.

C and D: Shop-Employee-Created Flows

- 1. In-shop: /workorders/inshop routes to /shop/new-inshop-job, then submit calls POST /api/workorders.
- 2. Road-call: /workorders/roadside routes to /shop/new-roadside-job.
- 3. Current road-call submit does not call a create API and only navigates back home.
- 4. Result: in-shop creates real work orders; roadside UI currently acts as a draft-only path.

What Work Order Does After Payment

- 1. Status and payment fields update to closed and paid.
- 2. Customer gets receipt email and push confirmation.
- 3. Customer sees closed confirmation on work order detail and payment pages.
- 4. Invoice generation and email endpoints are available for retrieval and sending.
- 5. If closure happens through PUT /api/workorders/[id], extra side effects run: loyalty points, review request email/SMS, and inventory deduction.

Source files used: customer appointments pages and API, shop new in-shop and roadside pages, workorders APIs, customer workorder detail and payments pages, stripe and payment webhooks, invoice endpoints.
