

FixTray Work Orders Wiring: Current Code vs Proposed Wiring

Built from current files: customer workorders pages, history page, appointments API, workorders APIs, customer workorder detail API, dashboard/navigation links.

AS-IS (Current Wiring In Code Today)

TO-BE (How I Would Wire It Now)

□ UI page or entry □ API endpoint □ Current friction/risk □ Proposed wiring □ WorkOrder data source

Key implementation moves shown in proposed side: 1) make /customer/workorders a real active list page, 2) keep /customer/history strictly for closed jobs, 3) unify detail fetch to /api/workorders/[id] with existing requireAuth style, 4) keep appointment work order creation, then route directly to /customer/workorders/[id] using returned workOrderId.
